

TagTeam® Technology

Two powerful technologies combined to benefit your pea and lentil crops

TagTeam® technology dual-action inoculant combines the phosphate-solubilizing microbe *Penicillium bilaiae* with a specially selected nitrogen-fixing rhizobia. It can create more fixed nitrogen and improve access to the relatively immobile phosphate in the soil, helping to provide the best yield potential for your pea and lentil crops.

BENEFITS OF USING TAGTEAM TECHNOLOGY

- Enhances nutrient availability including phosphate, which supports root and shoot growth, as well as nitrogen
- Improves fertilizer efficiency
- Greater opportunity for the development of nitrogen-fixing nodules
- Increases nitrogen fixation through nodule formation

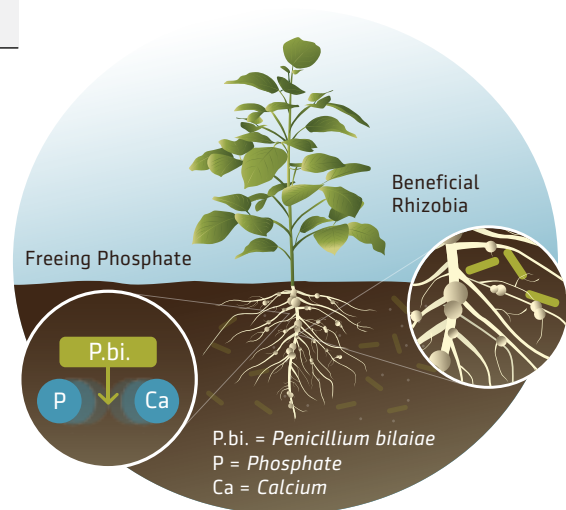

HOW THE TECHNOLOGY WORKS

1. Freeing Phosphate

Penicillium bilaiae releases bound mineral forms of soil and fertilizer phosphate, making it more available for the plant to use.

2. Beneficial Rhizobia

Specially selected rhizobia form a beneficial relationship with the plant, creating nodules which help fix atmospheric nitrogen.

Performance may vary from location to location and from year to year, as local growing, soil and weather conditions may vary. Growers should evaluate data from multiple locations and years whenever possible and should consider the impacts of these conditions on the grower's fields.
