

INCREASE PROFITABILITY POTENTIAL BY CHOOSING TO ROTATE

Three favorable aspects of rotating away from corn on corn

Many farmers grow corn on corn in their operation for economic reasons, but there are valuable benefits that come with rotating your crops every five years. Here are the top three reasons why rotating your crops is advantageous.

(1)

2

3

IT HELPS WITH PEST MANAGEMENT.

Choosing to rotate helps with insect and weed management as well as corn rootworm management in the Midwest. Because of corn rootworm, farmers pay more than \$1 billion annually in crop damage and increased control costs.* This notorious "billion-dollar bug" can be devastating, especially for fields that have been corn on corn for many years. Rotating to non-host crops can help drive corn rootworm pressure down to reduce corn rootworm feeding and standability losses while also mitigating resistance to traits and insecticides.

IT CREATES AN OPPORTUNITY FOR INPUT SAVINGS.

Rotating away from corn on corn helps save on inputs. This is key because nitrogen costs, biotech trait costs, insecticide costs, tillage and more can add up quickly when trying to maximize yield potential. Rotating to crops like soybeans can help lower overall input costs and potentially increase profitability.

IT OFFERS GREATER ROI AND YIELD POTENTIAL.

When growing corn on corn, there can be the potential for a yield hit or drag. By rotating to soybeans, you may see positive soil benefits through residue management, water management and increased nutrient availability. A reduction in diseases can also occur because the pathogens don't have a chance to live in the residue awaiting the following season. When you look at the combined benefits of crop rotation, you can see the possibility of a higher yield and profit potential.

FIELD NOTES FROM NICOLE STECKLEIN Bayer Technical Agronomist in Eastern Iowa

"I'm a technical agronomist in eastern lowa. In my part of the world, we have hills and a lot of livestock, so there's a lot of corn on corn in our area. For the last couple of years, this 30-acre plot we have hasn't been living up to its potential. I did a little digging and discovered that we were losing standability and quite a bit of yield to corn rootworm feeding. As much as you don't like to put your best 30 acres into soybeans, we felt like that was our best option because our number one issue is just that we have too many corn rootworms after years of corn on corn.

We didn't expect that we would have the bean yield that we did with over 90 bushels an acre on 30 acres. By giving that field a break from corn, it's going to help us with our residue management. It's going to make the seed costs lower because we can put a VT Double PRO® RIB Complete® product in that field so we don't have to pay for the extra traits. It's giving us a break as far as tillage goes, so now we can save costs on tillage."

"WE'RE HAPPY WITH THE BENEFITS THAT WE GOT THIS YEAR, BUT WE'RE ALSO LOOKING FORWARD TO THE POTENTIAL ECONOMIC AND AGRONOMIC BENEFITS FOR NEXT YEAR."

EXPLORE THE SHORT- AND LONG-TERM BENEFITS OF ROTATION

This calculator is a helpful tool when projecting potential costs. The costs below are estimates based on available third-party data and internal estimates and are for demonstration purposes only. Other variables like additional input costs, operational expenses or other discounts could affect the cost outcome in ways not shown below.

SCENARIO 1: ROTATE TO SO				
YEAR	MANAGEMENT	AVERAGE COST/A	OUT	COME
Year 1	Soybeans	\$72		Corn rootworm pressure reduced
Year 2	VT Double PRO® Technology	\$93		Minimized iscuss of
Year 3	SmartStax® Technology	\$105		standability and yield loss
		Total \$270		Least risk to trait longevity

SCENADIO 2. VE DOILBLE DON TECUNOLOGY + IN-EUDONW INSECTICIDE + ENLLAD INSECTICIDE			
JULINARIU Z. VI DUUDLE PRU TECHNULUUT + IN-FURRUW INSECTICIDE + FULIAR INSECTICIDE			OUTCOME
YEAR	MANAGEMENT	AVERAGE COST/A	
Year 1	VT Double PRO Technology + In-Furrow Insecticide + 2 Foliar Insecticide Applications for Adult Control	\$118-\$158	decrease but at a slower rate than by rotating to soybeans
Year 2	SmartStax Technology + 2 Foliar Insecticide Applications for Adult Control	\$120-\$145	Increased potential for standability issues and yield loss
Year 3	SmartStax Technology + 2 Foliar Insecticide Applications for Adult Control	\$120-\$145	in the first year with less risk in years two and three
		Total \$358-\$448	More risk to trait longevity

SCENARIO 3: SMARTSTAX	TECHNOLOGY + FOLIAR INSECTICIDE			
YEAR	MANAGEMENT	AVERAGE COST/A	OUT	COME
Year 1	SmartStax Technology + 2 Foliar Insecticide Applications for Adult Control	\$120-\$145		decrease but at a slower rate
Year 2	SmartStax Technology + 2 Foliar Insecticide Applications for Adult Control	\$120-\$145		
Year 3	SmartStax Technology + 2 Foliar Insecticide Applications for Adult Control	\$120-\$145		Standability issues and yield lo continue to be potential risks
		Total \$360-\$435		Most risk to trait longevity

Bayer is a member of Excellence Through Stewardship® (ETS). Bayer products are commercialized in accordance with ETS Product Launch Stewardship Guidance, and in compliance with Bayer's Policy for Commercialization of Biotechnology-Derived Plant Products in Commodity Crops. Commercialized products have been approved for import into key export markets with functioning regulatory systems. Any crop or material produced from this product can only be exported to, or used, processed or sold in countries where all necessary regulatory approvals have been granted. It is a violation of national and international law to move material containing biotech triats across boundaries into nations where import is not permitted. Growers should talk to their grain handler or product purchaser to confirm their buying position for this product. Excellence Through Stewardship® is a registered trademark of Excellence Through Stewardship.

ALWAYS READ AND FOLLOW PESTICIDE LABEL DIRECTIONS. B.t. products may not yet be registered in all states. Check with your seed brand representative for the registration status in your state.

IMPORTANT IRM INFORMATION: RIB Complete® corn blend products do not require the planting of a structured refuge except in the Cotton-Growing Area where corn earworm is a significant pest. See the IRM/Grower Guide for additional information Always read and follow IRM requirements.

Performance may vary, from location to location and from year to year, as local growing, soil and weather conditions may vary. Growers should evaluate data from multiple locations and years whenever possible and should consider the impacts of these conditions on the grower's fields.

Roundup Ready[®] 2 Technology contains genes that confer tolerance to glyphosate. Glyphosate will kill crops that are not tolerant to glyphosate.
