Corn Gray Leaf Spot Risk Forecast

For period of May 29 – June 26, Date of Issue: May 30, 2021

One-Month Weather Outlook

Over the next 30 days the temperatures will be warmer than normal across the Corn Belt. Precipitation north of I-80 will be near normal, and above normal south of I-80. During the next two weeks temperatures will be above normal with low rainfall north of I-70 and above average precipitation farther south.
Gray Leaf Spot Risk Summary

The risk for gray leaf spot in the Corn Belt is very low in this period of forecast.

Next two-week risk interpretation

Conditions over the next two weeks are unfavorable for the development of gray leaf spot in the Corn Belt as the crop is in early vegetative development. Follow the risk forecasts as corn growth progresses.
ONE-MONTH RISK MAP

WHAT TO DO?

HIGH	Treat susceptible hybrids and weigh risk factors for other fields
MODERATE	Scout fields and treat as conditions warrant
LOW OR VERY LOW	Monitor risk forecasts

Risk Level

| Very-low | Low | Moderate | High | Very-high |

Corn Common Rust
Risk Forecast

For period of May 29 – June 26, Date of Issue: May 30, 2021

One-Month Weather Outlook

Over the next 30 days the temperatures will be warmer than normal across the Corn Belt. Precipitation north of I-80 will be near normal, and above normal south of I-80. During the next two weeks temperatures will be above normal with low rainfall north of I-70 and above average precipitation farther south.
Common Rust Risk Summary

The risk of corn common rust is low to very low in the north except for some areas in Missouri.
Risk interpretation

The risk of corn common rust is low to very low for the next two weeks in the Corn Belt. The disease starts to move into southern Missouri. In areas of yellow conditions are moderately favorable to the disease.

ONE-MONTH RISK MAP

WHAT TO DO?

HIGH	Treat susceptible hybrids and weigh risk factors for other fields
MODERATE	Scout fields and treat as conditions warrant
LOW OR VERY LOW	Monitor risk forecasts

Risk Level   Very-low   Low   Moderate   High   Very-high

Corn Tar Spot Risk Forecast

For period of May 29 – June 26, Date of Issue: May 30, 2021

One-Month Weather Outlook

Over the next 30 days the temperatures will be warmer than normal across the Corn Belt. Precipitation north of I-80 will be near normal, and above normal south of I-80. During the next two weeks temperatures will be above normal with low rainfall north of I-70 and above average precipitation farther south.
Corn Tar Spot Risk Summary

The risk of corn tar spot in the Corn Belt is low to very low at this time.

Next two-week risk interpretation

Conditions over the next two weeks are unfavorable for corn tar spot development in the Corn Belt as the crop is in early vegetative stages. Follow the risk forecasts as the crop progresses.
ONE-MONTH RISK MAP

WHAT TO DO?

HIGH	Treat at the first sign of infection in your fields or the disease is developing in neighboring fields
MODERATE	Scout fields and treat as conditions warrant
LOW OR VERY LOW	Monitor risk forecasts
